# System F

Reference: Chapter 23 in Pierce's TAPL

Syntax

Reduction

$$\frac{}{\left(\lambda x:\tau.\;M_{1}\right)M_{2}\longrightarrow M_{1}\left[M_{2}/x\right]}\;\text{(E-AppAbs)}$$

$$\frac{M_{1}\longrightarrow M_{1}'}{M_{1}\;M_{2}\longrightarrow M_{1}'\;M_{2}}\;\text{(E-App1)}\qquad \frac{M_{2}\longrightarrow M_{2}'}{M_{1}\;M_{2}\longrightarrow M_{1}\;M_{2}'}\;\text{(E-App2)}$$

$$\frac{M\longrightarrow M'}{\lambda x:\tau.\;M\longrightarrow \lambda x:\tau.\;M'}\;\text{(E-Abs)}$$

Typing

$$\frac{\Gamma, x : \tau_1 \vdash M : \tau_2}{\Gamma, x : \tau \vdash x : \tau} \text{ (T-Var)} \qquad \frac{\Gamma, x : \tau_1 \vdash M : \tau_2}{\Gamma \vdash (\lambda x : \tau_1. \ M) : \tau_1 \to \tau_2} \text{ (T-Abs)}$$

$$\frac{\Gamma \vdash M_1 : \tau \to \tau' \qquad \Gamma \vdash M_2 : \tau}{\Gamma \vdash M_1 \ M_2 : \tau'} \text{ (T-App)}$$

Soundness

### Theorem (Preservation)

For all M, M' and  $\tau$ , if  $\bullet \vdash M : \tau$  and  $M \longrightarrow M'$ , then  $\bullet \vdash M' : \tau$ .

### Theorem (Progress)

For all M and  $\tau$ , if  $\bullet \vdash M : \tau$ , then either  $M \in \text{Values or } \exists M' . M \longrightarrow M'$ .

We can write an infinite number of "doubling" functions in STLC:

```
doubleNat \stackrel{\text{def}}{=} \lambda f : \text{Nat} \to \text{Nat. } \lambda x : \text{Nat. } f(fx)
doubleBool \stackrel{\text{def}}{=} \lambda f : \text{Bool} \to \text{Bool. } \lambda x : \text{Bool. } f(fx)
doubleFun \stackrel{\text{def}}{=} \lambda f : (\text{Nat} \to \text{Nat}) \to (\text{Nat} \to \text{Nat}). \lambda x : \text{Nat} \to \text{Nat. } f(fx)
```

Different types of arguments, but the same function body.

We can write an infinite number of "doubling" functions in STLC:

```
doubleNat \stackrel{\text{def}}{=} \lambda f : \text{Nat} \to \text{Nat. } \lambda x : \text{Nat. } f(fx)
doubleBool \stackrel{\text{def}}{=} \lambda f : \text{Bool} \to \text{Bool. } \lambda x : \text{Bool. } f(fx)
doubleFun \stackrel{\text{def}}{=} \lambda f : (\text{Nat} \to \text{Nat}) \to (\text{Nat} \to \text{Nat}). \lambda x : \text{Nat} \to \text{Nat. } f(fx)
```

Different types of arguments, but the same function body.

Can we abstract out the types?

# Polymorphism

poly = many, morph = formAllow a single piece of code to be used with multiple types.

Our focus: parametric polymorphism.

- Code is typed "generically", using variables in place of actual types, and then instantiated with particular types as needed.
- Uniform: all of their instances behave the same.
- By contrast, ad-hoc polymorphism (e.g. overloading) allows the code to exhibit different behaviors at different types.

# System F

System F was first discovered by Jean-Yves Girard (1972), in the context of proof theory in logic.

John Reynolds (1974) independently developed a type system with the same power, called *the polymorphic lambda-calculus*.

It is also sometimes called *the second-order lambda-calculus*, because it corresponds, via the Curry-Howard correspondence, to second-order intuitionistic logic, which allows quantification not only over individuals [terms], but also over predicates [types].

# **Syntax**

```
\begin{array}{lll} \text{(Terms)} & M & ::= & x \mid \lambda x : \tau. \ M \mid MM \mid \Lambda\alpha. \ M \mid M \langle \tau \rangle \\ \text{(Types)} & \tau & ::= & \alpha \mid T \mid \tau \rightarrow \tau \mid \forall \alpha. \ \tau \\ \text{(Values)} & v & ::= & \lambda x : \tau. \ M \mid \Lambda\alpha. \ M \end{array}
```

- Type variable α
- ▶ Type abstraction  $\Lambda \alpha$ . M
- ► Type application  $M\langle \tau \rangle$
- ► Universal type  $\forall \alpha$ .  $\tau$

### Reduction

$$\frac{\left(\lambda x:\tau.\ M_{1}\right)M_{2}\longrightarrow M_{1}\left[M_{2}/x\right]}{\left(\lambda x:\tau.\ M_{1}\right)M_{2}\longrightarrow M_{1}\left[M_{2}/x\right]} \stackrel{\text{(E-AppAbs)}}{\underbrace{M_{1}\ M_{2}\longrightarrow M_{1}'\ M_{2}}} \left(\text{E-App1}\right) \qquad \frac{M_{2}\longrightarrow M_{2}'}{M_{1}\ M_{2}\longrightarrow M_{1}\ M_{2}'} \stackrel{\text{(E-App2)}}{\underbrace{M_{1}\ M_{2}\longrightarrow M_{1}\ M_{2}'}} \left(\text{E-Abs)}\right) \\ \frac{M\longrightarrow M'}{\lambda x:\tau.\ M\longrightarrow \lambda x:\tau.\ M'} \stackrel{\text{(E-Abs)}}{\underbrace{(E-TAppTAbs)}} \\ \frac{M_{1}\longrightarrow M_{1}'}{M_{1}\langle\tau_{2}\rangle\longrightarrow M_{1}'\langle\tau_{2}\rangle} \stackrel{\text{(E-TApp)}}{\underbrace{(E-TApp)}} \qquad \frac{M\longrightarrow M'}{\Lambda\alpha.\ M\longrightarrow \Lambda\alpha.\ M'} \stackrel{\text{(E-TAbs)}}{\underbrace{(E-TAbs)}}$$

### **Statics**

Type well-formedness:  $\Delta \vdash \tau$ 

Typing judgment:  $\Delta$ ;  $\Gamma \vdash M : \tau$ 

# Type Well-Formedness

$$\frac{\Delta \vdash \tau_1 \qquad \Delta \vdash \tau_2}{\Delta \vdash \tau_1 \qquad \Delta \vdash \tau_2} \qquad \frac{\Delta, \alpha \vdash \tau}{\Delta \vdash \tau_1 \rightarrow \tau_2}$$

An alternative formulation:

$$\frac{\mathit{fv}(\tau) \subseteq \Delta}{\Delta \vdash \tau}$$

$$fv(\alpha) \stackrel{\text{def}}{=} \{\alpha\}$$
  $fv(T) \stackrel{\text{def}}{=} \emptyset$   $fv(\tau_1 \to \tau_2) \stackrel{\text{def}}{=} fv(\tau_1) \cup fv(\tau_2)$   
 $fv(\forall \alpha. \ \tau) \stackrel{\text{def}}{=} fv(\tau) - \{\alpha\}$ 

# **Typing**

$$\frac{\Delta \vdash \tau_{1} \qquad \Delta; \Gamma, x : \tau \vdash x : \tau}{\Delta; \Gamma, x : \tau_{1} \vdash M : \tau_{2}} \text{ (T-Abs)}$$

$$\frac{\Delta \vdash \tau_{1} \qquad \Delta; \Gamma, x : \tau_{1} \vdash M : \tau_{2}}{\Delta; \Gamma \vdash (\lambda x : \tau_{1}. M) : \tau_{1} \rightarrow \tau_{2}} \text{ (T-Abs)}$$

$$\frac{\Delta; \Gamma \vdash M_{1} : \tau \rightarrow \tau' \qquad \Delta; \Gamma \vdash M_{2} : \tau}{\Delta; \Gamma \vdash M_{1} M_{2} : \tau'} \text{ (T-App)}$$

$$\frac{\Delta, \alpha; \Gamma \vdash M : \tau}{\Delta; \Gamma \vdash (\Lambda \alpha. M) : \forall \alpha. \tau} \text{ (T-TAbs)}$$

$$\frac{\Delta; \Gamma \vdash M_{1} : \forall \alpha. \tau \qquad \Delta \vdash \tau_{2}}{\Delta; \Gamma \vdash M_{1} \langle \tau_{2} \rangle : \tau[\tau_{2}/\alpha]} \text{ (T-TApp)}$$

- ightharpoonup id  $\stackrel{\text{def}}{=} \Lambda \alpha$ .  $\lambda x : \alpha$ . x
  - ightharpoonup id :  $\forall \alpha. \ \alpha \rightarrow \alpha$
  - ightharpoonup id  $\langle Nat \rangle$ : Nat  $\rightarrow Nat$
  - $\qquad \qquad \text{id} \, \langle \text{Nat} \rightarrow \text{Nat} \rangle : \big( \text{Nat} \rightarrow \text{Nat} \big) \rightarrow \big( \text{Nat} \rightarrow \text{Nat} \big) \\$

  - ▶  $id \langle Nat \rightarrow Nat \rangle : (Nat \rightarrow Nat) \rightarrow (Nat \rightarrow Nat)$
- ▶ double  $\stackrel{\text{def}}{=} \Lambda \alpha. \lambda f : \alpha \to \alpha. \lambda x : \alpha. f(fx)$ 
  - ▶ double :  $\forall \alpha. (\alpha \rightarrow \alpha) \rightarrow \alpha \rightarrow \alpha$
  - ▶ double  $\langle Nat \rangle$  :  $(Nat \rightarrow Nat) \rightarrow Nat \rightarrow Nat$
- quadruple  $\stackrel{\text{def}}{=} \Lambda \alpha$ . double  $\langle \alpha \to \alpha \rangle$  (double  $\langle \alpha \rangle$ )
  - quadruple :  $\forall \alpha. (\alpha \rightarrow \alpha) \rightarrow \alpha \rightarrow \alpha$

- ightharpoonup id  $\stackrel{\text{def}}{=} \Lambda \alpha$ .  $\lambda x : \alpha$ . x
  - ▶ id :  $\forall \alpha. \ \alpha \rightarrow \alpha$
  - id ⟨Nat⟩ : Nat → Nat
  - ▶ id  $\langle Nat \rightarrow Nat \rangle$  :  $(Nat \rightarrow Nat) \rightarrow (Nat \rightarrow Nat)$
- ▶ double  $\stackrel{\text{def}}{=} \Lambda \alpha. \lambda f : \alpha \to \alpha. \lambda x : \alpha. f(fx)$ 
  - ▶ double :  $\forall \alpha. (\alpha \to \alpha) \to \alpha \to \alpha$
  - ▶ double  $\langle Nat \rangle$  :  $(Nat \rightarrow Nat) \rightarrow Nat \rightarrow Nat$
- ▶ quadruple  $\stackrel{\text{def}}{=} \Lambda \alpha$ . double  $\langle \alpha \to \alpha \rangle$  (double  $\langle \alpha \rangle$ )
  - quadruple :  $\forall \alpha. (\alpha \rightarrow \alpha) \rightarrow \alpha \rightarrow \alpha$
- ▶ selfApp  $\stackrel{\text{def}}{=} \lambda x : (\forall \alpha. \, \alpha \to \alpha). \, x \, \langle \forall \alpha. \, \alpha \to \alpha \rangle x$ 
  - ▶ selfApp :  $(\forall \alpha. \ \alpha \to \alpha) \to (\forall \alpha. \ \alpha \to \alpha)$
  - ▶ Recall in STLC there's no way to type  $\lambda x$ . x x.

## **Properties**

#### Theorem (Preservation)

For all M, M' and  $\tau$ , if  $\bullet$ ;  $\bullet \vdash M : \tau$  and  $M \longrightarrow M'$ , then  $\bullet$ ;  $\bullet \vdash M' : \tau$ .

### Theorem (Progress)

For all M and  $\tau$ , if  $\bullet$ ;  $\bullet \vdash M : \tau$ , then either  $M \in \text{Values or } \exists M'. M \longrightarrow M'.$ 

Strong normalization: Every reduction path starting from a well-typed System F term is guaranteed to terminate.

# **Church Encodings**

Recall in the untyped  $\lambda$ -calculus, we can encode boolean values:

True 
$$\stackrel{\text{def}}{=}$$
  $\lambda x. \lambda y. x$   
False  $\stackrel{\text{def}}{=}$   $\lambda x. \lambda y. y$ 

In System F:

# **Church Encodings**

Recall in the untyped  $\lambda$ -calculus, we can encode boolean values:

True 
$$\stackrel{\text{def}}{=} \lambda x. \lambda y. x$$
  
False  $\stackrel{\text{def}}{=} \lambda x. \lambda y. y$ 

In System F:

True 
$$\stackrel{\text{def}}{=}$$
  $\Lambda \alpha$ .  $\lambda x : \alpha$ .  $\lambda y : \alpha$ .  $x$   
False  $\stackrel{\text{def}}{=}$   $\Lambda \alpha$ .  $\lambda x : \alpha$ .  $\lambda y : \alpha$ .  $y$ 

Their type: Bool  $\stackrel{\text{def}}{=} \forall \alpha. \ \alpha \rightarrow \alpha \rightarrow \alpha.$ 

not 
$$\stackrel{\mathsf{def}}{=} \lambda b : \mathsf{Bool.} \ \Lambda \alpha . \ \lambda x : \alpha . \ \lambda y : \alpha . \ b \langle \alpha \rangle \ y \ x$$

Its type: Bool  $\rightarrow$  Bool.

# **Church Encodings**

Recall the untyped Church numerals:

$$\begin{array}{ccc}
\underline{0} & \stackrel{\text{def}}{=} & \lambda f. \ \lambda x. \ x \\
\underline{1} & \stackrel{\text{def}}{=} & \lambda f. \ \lambda x. \ f \ x \\
\underline{2} & \stackrel{\text{def}}{=} & \lambda f. \ \lambda x. \ f \ (f \ x)
\end{array}$$

In System F:

$$\begin{array}{ll} \underline{0} & \stackrel{\mathsf{def}}{=} & \Lambda \alpha. \ \lambda f : \alpha \to \alpha. \ \lambda x : \alpha. \ x \\ \underline{1} & \stackrel{\mathsf{def}}{=} & \Lambda \alpha. \ \lambda f : \alpha \to \alpha. \ \lambda x : \alpha. \ f \ x \\ \underline{2} & \stackrel{\mathsf{def}}{=} & \Lambda \alpha. \ \lambda f : \alpha \to \alpha. \ \lambda x : \alpha. \ f \ (f \ x) \end{array}$$

Read *TAPL* for the encodings of many other data and operators.

Parametricity: polymorphic terms behave uniformly on their type variables.

Given a parametrically polymorphic type, we know quite a bit about the behavior of any term of that type.

Parametricity: polymorphic terms behave uniformly on their type variables.

Given a parametrically polymorphic type, we know quite a bit about the behavior of any term of that type.

### Example

Write down all the functions that have type  $\forall \alpha. \ \alpha \rightarrow \alpha.$ 

Parametricity: polymorphic terms behave uniformly on their type variables.

Given a parametrically polymorphic type, we know quite a bit about the behavior of any term of that type.

### Example

Write down all the functions that have type  $\forall \alpha. \ \alpha \rightarrow \alpha.$ 

Every term you write behaves identically to  $\Lambda \alpha$ .  $\lambda x : \alpha$ . x.

Intuition: Because the term with type  $\forall \alpha.\ \alpha \to \alpha$  is polymorphic in  $\alpha$ , whatever it wants to do needs to work for every possible type  $\alpha$ , and the lambda calculus is so *simple* that the only such thing it can do is to *return the argument*.

Parametricity: polymorphic terms behave uniformly on their type variables.

Given a parametrically polymorphic type, we know quite a bit about the behavior of any term of that type.

### Example

Consider the type Bool  $\stackrel{\text{def}}{=} \forall \alpha. \ \alpha \to \alpha \to \alpha.$ 

Only two terms:  $\Lambda \alpha$ .  $\lambda x : \alpha$ .  $\lambda y : \alpha$ . x and  $\Lambda \alpha$ .  $\lambda x : \alpha$ .  $\lambda y : \alpha$ . y.

They are exactly the terms True and False.

Parametricity: polymorphic terms behave uniformly on their type variables.

Given a parametrically polymorphic type, we know quite a bit about the behavior of any term of that type.

### Example

Consider the type Bool  $\stackrel{\text{def}}{=} \ \forall \alpha. \ \alpha \to \alpha \to \alpha.$ 

Only two terms:  $\Lambda \alpha$ .  $\lambda x : \alpha$ .  $\lambda y : \alpha$ . x and  $\Lambda \alpha$ .  $\lambda x : \alpha$ .  $\lambda y : \alpha$ . y.

They are exactly the terms True and False.

Read the paper *Theorems for free!* written by Phil Wadler in 1989. It's a fun paper and a famous application of parametricity.

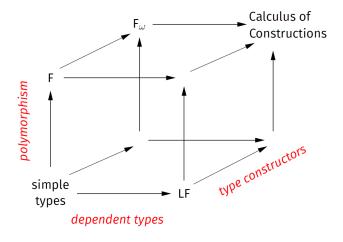

## Impredicativity

The polymorphism of System F is often called *impredicative*.

In general, a definition (of a set, a type, etc.) is called *impredicative* if it involves a quantifier whose domain includes the very thing being defined.

For example, in System F, the type variable  $\alpha$  in the type  $\tau = \forall \alpha. \ \alpha \to \alpha$  ranges over all types, including  $\tau$  itself (so that, for example, we can instantiate a term of type  $\tau$  at type  $\tau$ , yielding a function from  $\tau$  to  $\tau$ ).

#### Lambda Cube

Proposed by Henk Barendregt in 1991. The theoretical basis of Coq: Calculus of Inductive Constructions (CC + inductive definitions).
